#### Abstract

We define skew matrix gamma ring and describe the constitution of Jordan left centralizers and derivations on skew matrix gamma ring on a $\Gamma$-ring. We also show the properties of these concepts.

Keywords: Skew matrix ring, Gamma ring, Jordan left centralizer, Jordan left derivation and Centralizer.

## 1-Introduction

The linear ring mapping $\vartheta$ from $\mathbb{R}$ onto $\mathbb{R}$ is called a left derivation (LD ) (resp., Jordan left derivation (JLD)) if $\vartheta(\mathrm{xy})=\mathrm{x} \vartheta(\mathrm{y})+\mathrm{y} \vartheta(\mathrm{x}) \forall \mathrm{x}, \mathrm{y} \in \mathbb{R}$. (if $\left.\vartheta\left(\mathrm{x}^{2}\right)=2 \mathrm{x} \vartheta(\mathrm{x}) \forall \mathrm{x} \in \mathbb{R}\right)[1]$. Bresar and Vukman [2] introduced the concept of left derivation.We refer the readers to several references [3,4, $5,6]$ for results concerning Jordan left derivations. A linear mapping $\subseteq$ from $\mathbb{R}$ onto $\mathbb{R}$ is called Jordan left centralizers (JLC) (resp., left centralizers (LC)) if $\mathfrak{S}\left(a^{2}\right)=\mathfrak{S}(a) a$ (resp., $\mathfrak{S}(a b)=$ $\mathfrak{S}(a) b \forall \mathrm{a}, \mathrm{b} \in \mathbb{R})$. A linear map $\mathfrak{\subseteq}$ from $\mathbb{R}$ onto $\mathbb{R}$ is called a Jordan centralizer (JC) if $\mathfrak{\Im}$ satisfies $\mathfrak{S}$ (ab+ba)= $\subseteq$ (a) $b+\mathrm{b} \subseteq(\mathrm{a})=\mathfrak{S}$ (b) $\mathrm{a}+\mathrm{a} \mathfrak{S}$ (b) $\forall a, b \in \mathbb{R}$ [7]. In [7,8,9], some results about left centralizers were presented. In [10 ], Hamaguchi provided the sufficient and necessary conditions for J on a skew matrix ring being Jordan derivation. He proved that there exist many Jordan derivation maps of it, which are not derivations maps. He also studied the characterization of derivation on skew matrix ring $\left(\mathrm{M}_{2}(\mathbb{R} ; h, q)\right)$ and Jordan derivation of $\mathrm{M}_{2}(\mathbb{R})$ with invariant ideal. Nobusawa [11] introduced the concept of gamma ring, which was generalized by Barnes [12], as follows.

Let $\mathbb{R}$ and $\Gamma$ with + , . be abelian groups, $\mathbb{R}$ is called a gamma ring if for any $a, b, z \in \mathbb{R}$ and $\alpha, \beta \in$ $\Gamma$, then the following conditions satisfied
(1) $a \alpha b \in \mathbb{R}$
(2) $(a+b) \alpha z=a \alpha z+b \alpha z$
$a(\alpha+\beta) z=a \alpha z+a \beta z$
$a \alpha(b+z)=a \alpha b+a \alpha z$

[^0](3) $(a \alpha b) \beta z=a \alpha(b \beta z)$

Hamil and Majeed [13] studied the cocomutativity preserving right centralizer on a subset of a gamma rings. In [14], Majeed and Shaheen described a form of Jordan left derivation and centralizers on $\mathrm{M}_{2}(\mathbb{R} ; h, q)$. In this article, we define the skew matrix gamma ring and describe the constitution of Jordan left centralizers and the derivation of Skew matrix gamma ring on a $\Gamma$-ring M.We also show the properties of Jordan left derivation and centralizers on this ring.
Now, we shall introduce some definitions which are preliminaries in this paper.
Definition 1.1: [15]
Let $M$ be a ring $\mathrm{r}, \mathcal{q} \in M$, and the endomorphism $h: M \rightarrow M$, such that $h(q)=q$ and (r) $q=q$ r $\forall r \in M$.
Let $\mathrm{M}_{2}(M ; h, q)$ be a set of square $2 \times 2$ matrices on $M$ with multiplication
$\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right]\left[\begin{array}{ll}\mathrm{e} & \mathrm{i} \\ f & \mathrm{~g}\end{array}\right]=\left[\begin{array}{cc}\mathrm{ae}+\mathrm{bfq} & \mathrm{ai}+\mathrm{bg} \\ \mathrm{ch(e}(\mathrm{e})+\mathrm{df} & \mathrm{ch}(\mathrm{i}) q+\mathrm{dg}\end{array}\right]$
and the usual addition $\mathrm{M}_{2}(M ; h, q)$ is said to be a skew matrix ring over $M$.
In this article, we define the skew matrix gamma ring as follows.
Definition 1.2 : Skew Matrix Gamma Ring
Let M be a gamma ring r and $\mathrm{q} \in \mathrm{M}$ with $\sigma$ from M to M , where $\sigma(\mathrm{q})=\mathrm{q}$ and $\forall \mathrm{r} \in \mathrm{M}$ and $\alpha \in \Gamma$ $\sigma(r) \alpha q=q \alpha r$. Let $M_{2}(M ; \Gamma, \sigma, q)$ be the set of square $2 \times 2$ matrices over $M$ with multiplication
$\left[\begin{array}{ll}\mathrm{a}_{1} & \mathrm{a}_{2} \\ \mathrm{a}_{3} & \mathrm{a}_{4}\end{array}\right] \alpha\left[\begin{array}{ll}\mathrm{b}_{1} & \mathrm{~b}_{2} \\ b_{3} & \mathrm{~b}_{4}\end{array}\right]=\left[\begin{array}{cc}\mathrm{a}_{1} \alpha \mathrm{~b}_{1}+\mathrm{a}_{2} \alpha b_{3} \alpha \mathrm{q} & a_{1} \alpha \mathrm{~b}_{2}+a_{2} \alpha \mathrm{~b}_{4} \\ a_{3} \alpha \sigma\left(\mathrm{~b}_{1}\right)+a_{4} \alpha b_{3} & a_{3} \alpha \sigma\left(\mathrm{~b}_{2}\right) \alpha \mathrm{q}+a_{4} \alpha \mathrm{~b}_{4}\end{array}\right]$
and the usual addition $M_{2}(M ; \Gamma, \sigma, q)$ is said to be a skew matrix $\Gamma$-ring over M. Note that the matrix
$\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]$ is denoted by $e_{11} a+e_{12} b+e_{21} c+e_{22} d$.

## 2-On Skew Matrix Gamma Ring with Jordan Left Derivation

We shall describe the constitution of JLD on skew matrix gamma ring .
Let D be a JLD of $\mathrm{M}_{2}(\mathrm{M} ; \Gamma, \sigma, q)$. First, we set
$D\left(e_{11} a\right)=\left[\begin{array}{ll}\delta_{1}(a) & \delta_{2}(a) \\ \delta_{3}(a) & \delta_{4}(a)\end{array}\right], D\left(e_{12} b\right)=\left[\begin{array}{ll}\xi_{1}(b) & \xi_{2}(b) \\ \xi_{3}(b) & \xi_{4}(b)\end{array}\right]$
$D\left(e_{21} c\right)=\left[\begin{array}{ll}l_{1}(c) & l_{2}(c) \\ l_{3}(c) & l_{4}(c)\end{array}\right], D\left(e_{22} d\right)=\left[\begin{array}{ll}\Omega_{1}(d) & \Omega_{2}(d) \\ \Omega_{3}(d) & \Omega_{4}(d)\end{array}\right]$
where $\delta_{\mathrm{i}}, \Omega_{\mathrm{i}}, \xi_{\mathrm{i}}, l_{\mathrm{i}}: \mathrm{M} \rightarrow M$ are linear mappings .
Lemma 2.1: The mappings $\delta_{1}, \delta_{2}, \delta_{3}$ and $\delta_{3}$ satisfy the following conditions for every $\mathrm{a} \in \mathrm{M}, \alpha \in \Gamma$ :
$1-\delta_{1}$ and $\delta_{2}$ are JLD of M .
$2-\delta_{3}(\mathrm{a} \alpha a)=0$.
$3-\delta_{4}(\mathrm{a} \alpha a)=0$.
Proof: Since $\mathrm{D}\left(\mathrm{e}_{11}(\mathrm{a} \alpha a)\right)=\mathrm{D}\left(\mathrm{e}_{11} \mathrm{a} \alpha \mathrm{e}_{11} \mathrm{a}\right)$
and since D is JLD, then
$\mathrm{D}\left(\mathrm{e}_{11}(\mathrm{a} \alpha a)\right)=2 \mathrm{e}_{11} \mathrm{a} \alpha \mathrm{D}\left(\mathrm{e}_{11} \mathrm{a}\right)$
$\left[\begin{array}{ll}\delta_{1}(\mathrm{a} \alpha a) & \delta_{2}(\mathrm{a} \alpha a) \\ \delta_{3}(\mathrm{a} \alpha a) & \delta_{4}(\mathrm{a} \alpha a)\end{array}\right]=2\left[\begin{array}{ll}\mathrm{a} & 0 \\ 0 & 0\end{array}\right] \alpha\left[\begin{array}{ll}\delta_{1}(\mathrm{a}) & \delta_{2}(\mathrm{a}) \\ \delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})\end{array}\right]$
$\left[\begin{array}{ll}\delta_{1}(\mathrm{a} \alpha a) & \delta_{2}(\mathrm{a} \alpha a) \\ \delta_{3}(\mathrm{a} \alpha a) & \delta_{4}(\mathrm{a} \alpha a)\end{array}\right]=\left[\begin{array}{cc}2 \mathrm{a} \alpha \delta_{1}(\mathrm{a}) & 2 \mathrm{a} \alpha \delta_{2}(\mathrm{a}) \\ 0 & 0\end{array}\right]$
Then $\delta_{1}(\mathrm{a} \alpha a)=2 \mathrm{a} \alpha \delta_{1}(\mathrm{a}), \delta_{2}(\mathrm{a} \alpha a)=2 \mathrm{a} \alpha \delta_{2}(\mathrm{a}), \delta_{3}(\mathrm{a} \alpha a)=0$ and $\delta_{4}(\mathrm{a} \alpha a)=0$.
Lemma 2.2: The mappings $\Omega_{1}, \Omega_{2}, \Omega_{3}$, and $\Omega_{4}$ satisfy the following conditions for every $\mathrm{d} \in \mathrm{M}$ and $\alpha \in \Gamma$ :
$1-\Omega_{3}$ and $\Omega_{4}$ are JLD of M .
$2-\Omega_{1}(\mathrm{~d} \alpha d)=0$.
$3-\Omega_{2}(\mathrm{~d} \alpha d)=0$.
Proof: Since $\mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d} \alpha d\right)=\mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d} \alpha \mathrm{e}_{22} \mathrm{~d}\right)$
and since D is JLD, then
$\mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d} \alpha d\right)=2 \mathrm{e}_{22} \mathrm{~d} \alpha \mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d}\right)$
$\left[\begin{array}{ll}\Omega_{1}(\mathrm{~d} \alpha d) & \Omega_{2}(\mathrm{~d} \alpha d) \\ \Omega_{3}(\mathrm{~d} \alpha d) & \Omega_{4}(\mathrm{~d} \alpha d)\end{array}\right]=2\left[\begin{array}{ll}0 & 0 \\ 0 & \mathrm{~d}\end{array}\right] \alpha\left[\begin{array}{ll}\Omega_{1}(\mathrm{~d}) & \Omega_{2}(\mathrm{~d}) \\ \Omega_{3}(\mathrm{~d}) & \Omega_{4}(\mathrm{~d})\end{array}\right]$
$\left[\begin{array}{ll}\Omega_{1}(\mathrm{~d} \alpha d) & \Omega_{2}(\mathrm{~d} \alpha d) \\ \Omega_{3}(\mathrm{~d} \alpha d) & \Omega_{4}(\mathrm{~d} \alpha d)\end{array}\right]=\left[\begin{array}{cc}0 & 0 \\ 2 \mathrm{~d} \alpha \Omega_{3}(\mathrm{~d}) & 2 \mathrm{~d} \alpha \Omega_{4}(\mathrm{~d})\end{array}\right]$
then $\Omega_{3}(\mathrm{~d} \alpha d)=2 \mathrm{~d} \alpha \Omega_{3}(\mathrm{~d}), \Omega_{4}(\mathrm{~d} \alpha d)=2 \mathrm{~d} \alpha \Omega_{4}(\mathrm{~d}), \Omega_{1}(\mathrm{~d} \alpha d)=0$ and $\Omega_{2}(\mathrm{~d} \alpha d)=0$.
Lemma 2.3: If $\mathrm{a}, \mathrm{b} \in \mathrm{M}$ and $\alpha \in \Gamma$, then
1-

$$
\begin{aligned}
& \xi_{1}(\mathrm{a} \alpha \mathrm{~b})=2 \mathrm{a} \alpha \xi_{1}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{3}(\mathrm{a}) \alpha \mathrm{q} \\
& \xi_{2}(\mathrm{a} \alpha \mathrm{~b})=2 \mathrm{a} \alpha \xi_{2}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{4}(\mathrm{a}) \\
& \xi_{3}(\mathrm{a} \alpha \mathrm{~b})=0 \\
& \xi_{4}(\mathrm{a} \alpha \mathrm{~b})=0
\end{aligned}
$$

Proof: Since $e_{12}=e_{11} e_{12}+{ }_{12} e_{11}$, then
$D\left(\mathrm{e}_{12} \mathrm{a} \alpha \mathrm{b}\right)=\mathrm{D}\left(\mathrm{e}_{11} \mathrm{a} \alpha \mathrm{e}_{12} \mathrm{~b}+\mathrm{e}_{12} \mathrm{~b} \alpha \mathrm{e}_{11} \mathrm{a}\right)$
$\left[\begin{array}{ll}\xi_{1}(\mathrm{a} \alpha \mathrm{b}) & \xi_{2}(\mathrm{a} \alpha \mathrm{b}) \\ \xi_{3}(\mathrm{a} \alpha \mathrm{b}) & \xi_{4}(\mathrm{a} \alpha \mathrm{b})\end{array}\right]=2 \mathrm{e}_{11} \mathrm{a} \alpha \mathrm{D}\left(\mathrm{e}_{12} \mathrm{~b}\right)+2 \mathrm{e}_{12} \mathrm{~b} \alpha \mathrm{D}\left(\mathrm{e}_{11} \mathrm{a}\right)$

$$
=2\left[\begin{array}{ll}
\mathrm{a} & 0 \\
0 & 0
\end{array}\right] \alpha\left[\begin{array}{ll}
\xi_{1}(\mathrm{~b}) & \xi_{2}(\mathrm{~b}) \\
\xi_{3}(\mathrm{~b}) & \xi_{4}(\mathrm{~b})
\end{array}\right]+2\left[\begin{array}{ll}
0 & \mathrm{~b} \\
0 & 0
\end{array}\right] \alpha\left[\begin{array}{ll}
\delta_{1}(\mathrm{a}) & \delta_{2}(\mathrm{a}) \\
\delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})
\end{array}\right]
$$

$$
=\left[\begin{array}{cc}
2 \mathrm{a} \alpha \xi_{1}(\mathrm{~b}) & 2 \mathrm{a} \alpha \xi_{2}(\mathrm{~b}) \\
0 & 0
\end{array}\right]+\left[\begin{array}{cc}
2 \mathrm{~b} \alpha \delta_{3}(\mathrm{a}) \alpha \mathrm{q} & 2 \mathrm{~b} \alpha \delta_{4}(\mathrm{a}) \\
0 & 0
\end{array}\right]
$$

$=\left[\begin{array}{cc}2 \mathrm{a} \alpha \xi_{1}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{3}(\mathrm{a}) \alpha \mathrm{q} & 2 \mathrm{a} \alpha \xi_{2}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{4}(\mathrm{a}) \\ 0 & 0\end{array}\right]$
Lemma 2.4: The mappings $l_{1}, l_{2}, l_{3}$, and $l_{4}$ satisfy the following condition for every $c$ and $d \in M$ and $\alpha \in \Gamma$ :
$1-\mathrm{l}_{1}(\mathrm{~d} \alpha \mathrm{c})=0$
$2-\mathrm{l}_{2}(\mathrm{~d} \alpha \mathrm{c})=0$
$3-\mathrm{l}_{3}(\mathrm{~d} \alpha \mathrm{c})=2 \mathrm{~d} \alpha \mathrm{l}_{3}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{1}(\mathrm{~d})\right)$
$4-\mathrm{l}_{4}(\mathrm{~d} \alpha \mathrm{c})=2 \mathrm{~d} \alpha \mathrm{l}_{4}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{2}(\mathrm{~d})\right) \alpha \mathrm{q}$
Proof: Since $e_{21}=e_{22} e_{21}+e_{21} e_{22}$, then
$D\left(\mathrm{e}_{21} \mathrm{~d} \alpha \mathrm{c}\right)=\mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d} \alpha \mathrm{e}_{21} \mathrm{c}+\mathrm{e}_{21} \mathrm{c} \alpha \mathrm{e}_{22} \mathrm{~d}\right)$
$\left[\begin{array}{ll}\mathrm{l}_{1}(\mathrm{~d} \alpha \mathrm{c}) & \mathrm{l}_{2}(\mathrm{~d} \alpha \mathrm{c}) \\ \mathrm{l}_{3}(\mathrm{~d} \alpha \mathrm{c}) & \mathrm{l}_{4}(\mathrm{~d} \alpha \mathrm{c})\end{array}\right]=2 \mathrm{e}_{22} \mathrm{~d} \alpha D\left(\mathrm{e}_{21} \mathrm{c}\right)+2 \mathrm{e}_{21} \mathrm{c} \alpha \mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d}\right)$
$=\left[\begin{array}{cc}0 & 0 \\ 0 & 2 d\end{array}\right] \alpha\left[\begin{array}{ll}\mathrm{l}_{1}(\mathrm{c}) & \mathrm{l}_{2}(\mathrm{c}) \\ \mathrm{l}_{3}(\mathrm{c}) & \mathrm{l}_{4}(\mathrm{c})\end{array}\right]+\left[\begin{array}{cc}0 & 0 \\ 2 \mathrm{c} & 0\end{array}\right] \alpha\left[\begin{array}{ll}\Omega_{1}(\mathrm{~d}) & \Omega_{2}(\mathrm{~d}) \\ \Omega_{3}(\mathrm{~d}) & \Omega_{4}(\mathrm{~d})\end{array}\right]$
$=\left[\begin{array}{cc}0 & 0 \\ 2 \mathrm{~d} \alpha \mathrm{l}_{3}(\mathrm{c}) & 2 \mathrm{~d} \alpha \mathrm{l}_{4}(\mathrm{c})\end{array}\right]+\left[\begin{array}{cc}0 & 0 \\ 2 \mathrm{c} \alpha \sigma\left(\Omega_{1}(\mathrm{~d})\right) & 2 \mathrm{c} \alpha \sigma\left(\Omega_{2}(\mathrm{~d})\right) \alpha \mathrm{q}\end{array}\right]$
$=\left[\begin{array}{ccc}0 & 0 \\ 2 \mathrm{~d} \alpha \mathrm{l}_{3}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{1}(\mathrm{~d})\right) & 2 \mathrm{~d} \alpha \mathrm{l}_{4}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{2}(\mathrm{~d})\right) \alpha \mathrm{q}\end{array}\right]$
Theorem 2.5: If $M$ is a gamma ring and $D$ is a JLD of $M_{2}(M, \Gamma ; \sigma, q)$,
then $D\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right]=\left[\begin{array}{ll}\delta_{1}(\mathrm{a})+\xi_{1}(\mathrm{~b})+\mathrm{l}_{1}(\mathrm{c})+\Omega_{1}(\mathrm{~d}) & \delta_{2}(\mathrm{a})+\xi_{2}(\mathrm{~b})+\mathrm{l}_{2}(\mathrm{c})+\Omega_{2}(\mathrm{~d}) \\ \delta_{3}(\mathrm{a})+\xi_{3}(\mathrm{~b})+\mathrm{l}_{3}(\mathrm{c})+\Omega_{3}(\mathrm{~d}) & \delta_{4}(\mathrm{a})+\xi_{4}(\mathrm{~b})+\mathrm{l}_{4}(\mathrm{c})+\Omega_{4}(\mathrm{~d})\end{array}\right]$
such that
$1-\delta_{3}(\mathrm{a} \alpha a)=0, \delta_{4}\left(\mathrm{a}^{2}\right)=0, \delta_{1}, \delta_{2}$ are Jordan left derivation of M .
$2-\Omega_{1}(\mathrm{~d} \alpha d)=0, \Omega_{2}(\mathrm{~d} \alpha d)=0 \Omega_{3}$ and $\Omega_{4}$ are Jordan left derivation of M.
3-
$\xi_{1}(\mathrm{a} \alpha \mathrm{b})=2 \mathrm{a} \alpha \xi_{1}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{3}(\mathrm{a}) \alpha \mathrm{q}, \xi_{2}(\mathrm{a} \alpha \mathrm{b})=2 \mathrm{a} \alpha \xi_{2}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{4}(\mathrm{a}), \xi_{3}(\mathrm{a} \alpha \mathrm{b})=$
0 and $\xi_{4}(\mathrm{a} \alpha \mathrm{b})=0$
$4-\mathrm{l}_{1}(\mathrm{~d} \alpha \mathrm{c})=0, \mathrm{l}_{2}(\mathrm{~d} \alpha \mathrm{c})=0, \mathrm{l}_{3}(\mathrm{~d} \alpha \mathrm{c})=2 \mathrm{~d}^{2} \mathrm{l}_{3}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{1}(\mathrm{~d})\right)$ and
$\mathrm{l}_{4}(\mathrm{~d} \alpha \mathrm{c})=2 \mathrm{~d} \alpha \mathrm{l}_{4}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{2}(\mathrm{~d})\right) \alpha \mathrm{q}$.
Proof: Since $D\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]=D\left(e_{11} a\right)+D\left(e_{12} b\right)+D\left(e_{21} c\right)+D\left(e_{22} d\right)$

$$
\begin{aligned}
&=\left[\begin{array}{ll}
\delta_{1}(\mathrm{a}) & \delta_{2}(\mathrm{a}) \\
\delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})
\end{array}\right]+\left[\begin{array}{ll}
\xi_{1}(\mathrm{~b}) & \xi_{2}(\mathrm{~b}) \\
\xi_{3}(\mathrm{~b}) & \xi_{4}(\mathrm{~b})
\end{array}\right]+\left[\begin{array}{ll}
\mathrm{l}_{1}(\mathrm{c}) & \mathrm{l}_{2}(\mathrm{c}) \\
\mathrm{l}_{3}(\mathrm{c}) & \mathrm{l}_{4}(\mathrm{c})
\end{array}\right]+\left[\begin{array}{ll}
\Omega_{1}(\mathrm{~d}) & \Omega_{2}(\mathrm{~d}) \\
\Omega_{3}(\mathrm{~d}) & \Omega_{4}(\mathrm{~d})
\end{array}\right] \\
&=\left[\begin{array}{ll}
\delta_{1}(\mathrm{a})+\xi_{1}(\mathrm{~b})+\mathrm{l}_{1}(\mathrm{c})+\Omega_{1}(\mathrm{~d}) & \delta_{2}(\mathrm{a})+\xi_{2}(\mathrm{~b})+\mathrm{l}_{2}(\mathrm{c})+\Omega_{2}(\mathrm{~d}) \\
\delta_{3}(\mathrm{a})+\xi_{3}(\mathrm{~b})+\mathrm{l}_{3}(\mathrm{c})+\Omega_{3}(\mathrm{~d}) & \delta_{4}(\mathrm{a})+\xi_{4}(\mathrm{~b})+\mathrm{l}_{4}(\mathrm{c})+\Omega_{4}(\mathrm{~d})
\end{array}\right]
\end{aligned}
$$

Then, by the assertion Lemmas 2.1, 2.2, 2.3, and 2.4, we shall get the result .
Lemma 2.6: If $M$ is a gamma ring with 1 and $D$ is a $\operatorname{JLD}$ of $M_{2}(M, \Gamma ; \sigma, q)$, then there exist additive mappings $\delta_{3}, \delta_{4}, \xi_{3}, \xi_{4}, l_{1}, l_{2}, \Omega_{1}$, and $\Omega_{2}: M \rightarrow M$
and elements $\mu, \vartheta, \omega, \tau, \gamma, \mathcal{K}, \rho, \varepsilon$ in M , such that for all a,b,c,d in M, we have
$\mathrm{D}\left(\mathrm{e}_{11} \mathrm{a}\right)=\left[\begin{array}{cc}\mathrm{a} \alpha \mu & \mathrm{a} \alpha \vartheta \\ \delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})\end{array}\right]$,
$\mathrm{D}\left(\mathrm{e}_{12} \mathrm{~b}\right)=\left[\begin{array}{cc}2 \mathrm{~b} \alpha \omega+2 \delta_{3}(\mathrm{~b}) \alpha \mathrm{q} & 2 \mathrm{~b} \alpha \tau+2 \delta_{4}(\mathrm{~b}) \\ \xi_{3}(\mathrm{~b}) & \xi_{4}(\mathrm{~b})\end{array}\right]$
$\mathrm{D}\left(\mathrm{e}_{21} \mathrm{c}\right)=\left[\begin{array}{cc}\mathrm{l}_{1}(\mathrm{c}) & \mathrm{l}_{2}(\mathrm{c}) \\ 2 \mathrm{c} \alpha \gamma+2 \sigma\left(\Omega_{1}(\mathrm{c})\right) & 2 \mathrm{c} \alpha \kappa+2 \sigma\left(\Omega_{2}(\mathrm{c})\right) \alpha \mathrm{q}\end{array}\right], \mathrm{D}\left(\mathrm{e}_{22} \mathrm{~d}\right)=\left[\begin{array}{cc}\Omega_{1}(\mathrm{~d}) & \Omega_{2}(\mathrm{~d}) \\ \mathrm{d} \alpha \rho & \mathrm{d} \alpha \varepsilon\end{array}\right]$
Proof : By Lemma 2.1.1, we have

$$
\delta_{1}(\mathrm{a} \alpha a)=2 \mathrm{a} \alpha \delta_{1}(\mathrm{a})
$$

then
By

$$
\begin{aligned}
& \text { putting } \\
& \delta_{1}(\mathrm{a} \alpha b+b \alpha a)=\underset{\mathrm{b}=1,}{\mathrm{a} \alpha \delta_{1}(\mathrm{~b})+b \alpha \delta_{1}(\mathrm{a})} \quad \text { we }
\end{aligned}
$$

$$
\delta_{1}(\mathrm{a})=\mathrm{a} \alpha \delta_{1}(1)
$$

And since $\delta_{2}(\mathrm{a} \alpha a)=2 \mathrm{a} \alpha \delta_{2}(\mathrm{a})$, then $\delta_{2}(\mathrm{a})=\mathrm{a} \alpha \delta_{2}(1)$.
We choose $\mu=\delta_{1}(1), \vartheta=\delta_{2}(1), \quad$ then we have
and

$$
\delta_{1}(\mathrm{a})=\mathrm{a} \alpha \mu
$$

$$
\delta_{2}(\mathrm{a})=\mathrm{a} \alpha \vartheta
$$

By the same way, we get from lemma 2.2 that $\Omega_{3}(\mathrm{~d})=\mathrm{d} \alpha \Omega_{3}(1), \Omega_{4}(d)=\mathrm{d} \alpha \Omega_{4}(1)$.
We choose $\rho=\Omega_{3}(1)$ and $\varepsilon=\Omega_{4}(1)$, then $\Omega_{3}(\mathrm{~d})=\mathrm{d} \alpha \rho, \Omega_{4}(d)=\mathrm{d} \alpha \varepsilon$.
And from lemma 2.3, we have
$\xi_{1}(\mathrm{a} \alpha \mathrm{b})=2 \mathrm{a} \alpha \xi_{1}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{3}(\mathrm{a}) \alpha \mathrm{q}$, and by putting $\mathrm{a}=1$, we get
$\xi_{1}(a)=2 \mathrm{a} \alpha \xi_{1}(1)+2 \delta_{3}(\mathrm{a}) \alpha \mathrm{q}$
and
$\xi_{2}(\mathrm{a} \alpha \mathrm{b})=2 \mathrm{a} \alpha \xi_{2}(\mathrm{~b})+2 \mathrm{~b} \alpha \delta_{4}(\mathrm{a})$ also by putting $\mathrm{b}=1$, we get $\xi_{2}(\mathrm{a})=2 \mathrm{a} \alpha \xi_{2}(1)+2 \delta_{4}(\mathrm{a})$
By putting $\tau=\xi_{2}(1)$ and $\omega=\xi_{1}(1)$, and from lemma 2.4, we have

$$
\mathrm{l}_{3}(\mathrm{~d} \alpha \mathrm{c})=2 \mathrm{~d} \alpha \mathrm{l}_{3}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{1}(\mathrm{~d})\right)
$$

Also, we put $\mathrm{c}=1, \mathrm{l}_{3}(\mathrm{~d})=2 \mathrm{~d} \alpha \mathrm{l}_{3}(1)+2 \sigma\left(\Omega_{1}(\mathrm{~d})\right)$
and $\mathrm{l}_{4}(\mathrm{~d} \alpha \mathrm{c})=2 \mathrm{~d} \alpha \mathrm{l}_{4}(\mathrm{c})+2 \mathrm{c} \alpha \sigma\left(\Omega_{2}(\mathrm{~d})\right) \alpha \mathrm{q}$. Furthermore, we put $\mathrm{c}=1, \mathrm{l}_{4}(\mathrm{~d})=2 \mathrm{~d} \alpha \mathrm{l}_{4}(1)+$ $2 \sigma\left(\Omega_{2}(\mathrm{~d})\right) \alpha \mathrm{q}$. We then put $\gamma=\mathrm{l}_{3}(1)$ and $\mathrm{l}_{4}(1)=\aleph$. Then, we get the result.
Theorem 2.7: If $M$ is a gamma ring with 1 and $D: M_{2}(M, \Gamma ; \sigma, q) \rightarrow M_{2}(M, \Gamma ; \sigma, q)$ is an additive mapping .Then, D is a JLD if and only if there exist additive mappings $\delta_{3}, \mathrm{l}_{1}, \Omega_{1}, \xi_{3}, \delta_{4}, \xi_{4}$ and elements $\mu, \omega, \vartheta, \tau, \gamma, \rho, \aleph, \varepsilon$ satisfying the four conditions in Lemma 2.6 with the following conditions, for all $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ in M .
(i) $\delta_{3}(\mathrm{a} \alpha a)=0$.
(ii) $\delta_{4}(\mathrm{a} \alpha a)=0$.
(iii) $\Omega_{1}(\mathrm{~d} \alpha d)=0$.
(iv) $\Omega_{2}(\mathrm{~d} \alpha d)=0$.
(v) $\xi_{3}(\mathrm{a} \alpha \mathrm{b})=0$.
$(\mathrm{vi}) \xi_{4}(\mathrm{a} \alpha \mathrm{b})=0$.
$\left(\right.$ vii) $l_{1}(\mathrm{~d} \alpha \mathrm{c})=0$.
(viii) $\mathrm{l}_{2}(\mathrm{~d} \alpha \mathrm{c})=0$.

Particularly, a Jordan left derivation of $\mathrm{M}_{2}(\mathrm{M}, \Gamma ; \sigma, q)$ is given by
$D\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right]=$
$\left[\begin{array}{cc}\mathrm{a} \alpha \mu+2 \mathrm{~b} \alpha \omega+2 \delta_{3}(\mathrm{~b}) \alpha \mathrm{q}+\mathrm{l}_{1}(\mathrm{c})+\Omega_{1}(\mathrm{~d}) & \mathrm{a} \alpha \vartheta+2 \mathrm{~b} \alpha \tau+2 \delta_{4}(\mathrm{~b})+\mathrm{l}_{2}(\mathrm{c})+\Omega_{2}(\mathrm{~d}) \\ \delta_{3}(\mathrm{a})+\xi_{3}(\mathrm{~b})+2 \mathrm{c} \alpha \gamma+2 \sigma\left(\Omega_{1}(\mathrm{c})\right)+\mathrm{d} \alpha \rho & \delta_{4}(\mathrm{a})+\xi_{4}(\mathrm{~b})+2 \mathrm{c} \alpha \kappa+2 \sigma\left(\Omega_{2}(\mathrm{c})\right) \alpha \mathrm{q}+\mathrm{d} \alpha \varepsilon\end{array}\right]$.
Proof: Assume that $D$ is A Jordan left derivation of $M_{2}(M, \Gamma ; \sigma, q)$. Then, $D$ satisfies the above condition for some additive mappings, by Lemmas 2.6 and 2.4.
Conversely, if the mappings $\delta_{3}, \mathrm{l}_{1}, \Omega_{1}, \Omega_{2}, \xi_{3}, \delta_{4}, \xi_{4}$ and elements $\mu, \omega, \vartheta, \tau, \gamma, \rho, \aleph, \varepsilon$ satisfy the above condition, then we can show that, for any $A=\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]$ in $M_{2}(M, \Gamma ; \sigma, q)$,
$\mathrm{D}(\mathrm{A} \alpha \mathrm{A})=2 \mathrm{D}(\mathrm{A})) \alpha \mathrm{A}$,
by direct calculation.

## 3- On Skew Matrix Gamma Ring and Jordan Left Centralizer

Let $J$ be a $\mathbf{J L C}$ of $M_{2}(M, \Gamma ; \sigma, q)$. First, we set
$J\left(e_{11} a\right)=\left[\begin{array}{ll}\delta_{1}(a) & \delta_{2}(a) \\ \delta_{3}(a) & \delta_{4}(a)\end{array}\right], J\left(e_{12} b\right)=\left[\begin{array}{ll}l_{1}(b) & l_{2}(b) \\ l_{3}(b) & l_{4}(b)\end{array}\right]$
$J\left(e_{21} c\right)=\left[\begin{array}{ll}k_{1}(c) & k_{2}(c) \\ k_{3}(c) & k_{4}(c)\end{array}\right] J\left(e_{22} d\right)=\left[\begin{array}{ll}\eta_{1}(d) & \eta_{2}(d) \\ \eta_{3}(d) & \eta_{4}(d)\end{array}\right]$
where $\delta_{i}, k_{i}, \eta_{i}, l_{i}: M \rightarrow M$ are linear maps.
Lemma 3.1: The mappings $\delta_{1}, \delta_{2}, \delta_{3}$ and $\delta_{3}$ satisfy the following conditions for every $\mathrm{a} \in \mathrm{M}$ and $\alpha \in \Gamma$.
1- $\delta_{1}$ is JLC of M.
2- $\delta_{2}(\mathrm{a} \alpha a)=0$.
$3-\delta_{3}(\mathrm{a} \alpha a)=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{a})$.
$4-\delta_{4}(\mathrm{a} \alpha a)=0$.
Proof: Since $\mathrm{J}\left(\mathrm{e}_{11} \mathrm{a} \alpha a\right)=\mathrm{J}\left(\mathrm{e}_{11} \mathrm{a} \alpha \mathrm{e}_{11} a\right)$
and since J is JLC, then
$\mathrm{J}\left(\mathrm{e}_{11} \mathrm{a} \alpha a\right)=\mathrm{J}\left(\mathrm{e}_{11} \mathrm{a}\right) \alpha \mathrm{e}_{11} \mathrm{a}$
$\left[\begin{array}{ll}\delta_{1}(\mathrm{a} \alpha a) & \delta_{2}(\mathrm{a} \alpha a) \\ \delta_{3}(\mathrm{a} \alpha a) & \mathrm{f}_{4}(a \alpha a)\end{array}\right]=\left[\begin{array}{ll}\delta_{1}(\mathrm{a}) & \delta_{2}(\mathrm{a}) \\ \delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})\end{array}\right] \alpha\left[\begin{array}{ll}\mathrm{a} & 0 \\ 0 & 0\end{array}\right]$
$\left[\begin{array}{ll}\delta_{1}(\mathrm{a} \alpha a) & \delta_{2}(\mathrm{a} \alpha a) \\ \delta_{3}(\mathrm{a} \alpha a) & \delta_{4}(\mathrm{a} \alpha a)\end{array}\right]=\left[\begin{array}{cc}\delta_{1}(\mathrm{a}) \alpha \mathrm{a} & 0 \\ \delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{a}) & 0\end{array}\right]$
Then $\delta_{1}(\mathrm{a} \alpha a)=\delta_{1}(\mathrm{a}) \alpha \mathrm{a}, \delta_{2}(\mathrm{a} \alpha a)=0, \delta_{3}(\mathrm{a} \alpha a)=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{a})$ and $\delta_{4}(\mathrm{a} \alpha a)=0$.
Lemma 3.2: If $\mathrm{d} \in \mathrm{M}$ and $\alpha \in \Gamma$, then the mappings $\eta_{1}, \eta_{2}, \eta_{3}$ and $\eta_{4}$ satisfy the following

$$
\begin{aligned}
& \eta_{2}, \eta_{4} \text { are JLCs of } \mathrm{M} . \\
& \eta_{1}(\mathrm{~d} \alpha d)=0
\end{aligned}
$$

3- $\quad \eta_{3}(\mathrm{~d} \alpha d)=0$.

## Proof: Since

$\mathrm{J}\left(\mathrm{e}_{22} \mathrm{~d} \alpha d\right)=\mathrm{J}\left(\left(\mathrm{e}_{22} \mathrm{~d}\right) \alpha\left(\mathrm{e}_{22} \mathrm{~d}\right)\right)$
and since J is JLC , then
$J\left(e_{22} \mathrm{~d} \alpha d\right)=\mathrm{J}\left(\mathrm{e}_{22} \mathrm{~d}\right) \alpha \mathrm{e}_{22} \mathrm{~d}\left[\begin{array}{ll}\mathrm{H}_{1}(\mathrm{~d} \alpha d) & \eta_{2}(\mathrm{~d} \alpha d) \\ \eta_{3}(\mathrm{~d} \alpha d) & \eta_{4}(\mathrm{~d} \alpha d)\end{array}\right]=\left[\begin{array}{ll}\eta_{1}(\mathrm{~d}) & \eta_{2}(\mathrm{~d}) \\ \eta_{3}(\mathrm{~d}) & \eta_{4}(\mathrm{~d})\end{array}\right] \alpha\left[\begin{array}{ll}0 & 0 \\ 0 & \mathrm{~d}\end{array}\right]=\left[\begin{array}{ll}0 & \eta_{2}(\mathrm{~d}) \alpha \mathrm{d} \\ 0 & \eta_{4}(\mathrm{~d}) \alpha \mathrm{d}\end{array}\right]$.
Then $\eta_{1}(\mathrm{~d} \alpha d)=0, \eta_{3}(\mathrm{~d} \alpha d)=0 \& \eta_{2}, \eta_{4}$ are JLCs of M .
Lemma 3.3: The mappings $l_{1}, l_{2}, l_{3}$ and $l_{4}$ satisfy the following condition for every $a, b \in M$ and $\alpha \in \Gamma$ :
For every $a, b \in M$,
$1-l_{1}(\mathrm{a} \alpha \mathrm{b})=l_{1}(\mathrm{~b}) \alpha \mathrm{a}$.
$2-\mathrm{l}_{2}(\mathrm{a} \alpha \mathrm{b})=\delta_{1}(\mathrm{a}) \alpha \mathrm{b}$.
$3-l_{3}(\mathrm{a} \alpha \mathrm{b})=l_{3}(\mathrm{~b}) \alpha \sigma(\mathrm{a})$.
$4-\mathrm{l}_{4}(\mathrm{a} \alpha \mathrm{b})=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}$.
Proof: Since $J\left(e_{12} a \alpha b\right)=J\left(e_{11} a \alpha e_{12} b+e_{12} b \alpha e_{11} a\right)$

$$
\begin{aligned}
{\left[\begin{array}{ll}
\mathrm{l}_{1}(\mathrm{a} \alpha \mathrm{~b}) & \mathrm{l}_{2}(\mathrm{a} \alpha \mathrm{~b}) \\
\mathrm{l}_{3}(\mathrm{a} \alpha \mathrm{~b}) & \mathrm{l}_{4}(\mathrm{a} \alpha \mathrm{~b})
\end{array}\right] } & =\mathrm{J}\left(\mathrm{e}_{11} \mathrm{a}\right) \alpha \mathrm{e}_{12} \mathrm{~b}+\mathrm{J}\left(\mathrm{e}_{12} \mathrm{~b}\right) \alpha \mathrm{e}_{11} \mathrm{a} \\
& =\left[\begin{array}{lll}
\delta_{1}(\mathrm{a}) & \delta_{2}(\mathrm{a}) \\
\delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})
\end{array}\right] \alpha\left[\begin{array}{ll}
0 & \mathrm{~b} \\
0 & 0
\end{array}\right]+\left[\begin{array}{ll}
\mathrm{l}_{1}(\mathrm{~b}) & \mathrm{l}_{2}(\mathrm{~b}) \\
\mathrm{l}_{3}(\mathrm{~b}) & \mathrm{l}_{4}(\mathrm{~b})
\end{array}\right] \alpha\left[\begin{array}{cc}
\mathrm{a} & 0 \\
0 & 0
\end{array}\right] \\
= & {\left[\begin{array}{ccc}
0 & \delta_{1}(\mathrm{a}) \alpha \mathrm{b} & \\
0 & \delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}
\end{array}\right]+\left[\begin{array}{cc}
\mathrm{l}_{1}(\mathrm{~b}) \alpha \mathrm{a} & 0 \\
\mathrm{l}_{3}(\mathrm{~b}) \alpha \sigma(\mathrm{a}) & 0
\end{array}\right] } \\
& =\left[\begin{array}{cc}
\mathrm{l}_{1}(\mathrm{~b}) \alpha \mathrm{a} & \delta_{1}(\mathrm{a}) \alpha \mathrm{b} \\
\mathrm{l}_{3}(\mathrm{~b}) \alpha \sigma(\mathrm{a}) & \delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}
\end{array}\right],
\end{aligned}
$$

then $\mathrm{l}_{1}(\mathrm{a} \alpha \mathrm{b})=\mathrm{l}_{1}(\mathrm{~b}) \alpha \mathrm{a}, l_{2}(\mathrm{a} \alpha \mathrm{b})=\delta_{1}(\mathrm{a}) \alpha \mathrm{b}, \mathrm{l}_{3}(\mathrm{a} \alpha \mathrm{b})=\mathrm{l}_{3}(\mathrm{~b}) \alpha \sigma(\mathrm{a})$ and
$l_{4}(\mathrm{a} \alpha \mathrm{b})=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}$.
Lemma 3.4 : The mappings $k_{1}, k_{2}, k_{3}$ and $k_{4}$ satisfy the following conditions for every $\mathrm{c}, \mathrm{d} \in \mathrm{M}, \alpha \in$ $\Gamma$ :
$1-k_{1}(\mathrm{~d} \alpha \mathrm{c})=\eta_{2}(\mathrm{~d}) \alpha \mathrm{c} \alpha \mathrm{q}$.
$2-\mathrm{k}_{2}(\mathrm{~d} \alpha \mathrm{c})=\eta_{2}(\mathrm{c}) \alpha \mathrm{d}$.
$3-\mathrm{k}_{3}(\mathrm{~d} \alpha \mathrm{c})=\eta_{4}(\mathrm{~d}) \alpha \mathrm{c}$.
$4-\mathrm{k}_{4}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{4}(\mathrm{c}) \alpha \mathrm{d}$.
Proof: Since

$$
\begin{aligned}
& \mathrm{J}\left(\mathrm{e}_{21} \mathrm{~d} \alpha \mathrm{c}\right)=\mathrm{J}\left(\mathrm{e}_{22} \mathrm{~d} \alpha \mathrm{e}_{21} \mathrm{c}+\mathrm{e}_{21} \mathrm{c} \alpha \mathrm{e}_{22} \mathrm{~d}\right) \\
& {\left[\begin{array}{ll}
\mathrm{k}_{1}(\mathrm{~d} \alpha \mathrm{c}) & \mathrm{k}_{2}(\mathrm{~d} \alpha \mathrm{c}) \\
\mathrm{k}_{3}(\mathrm{~d} \alpha \mathrm{c}) & \mathrm{k}_{4}(\mathrm{~d} \alpha \mathrm{c})
\end{array}\right]=\mathrm{J}\left(\mathrm{e}_{22} \mathrm{~d}\right) \alpha \mathrm{e}_{21} \mathrm{c}+\mathrm{J}\left(\mathrm{e}_{21} \mathrm{c}\right) \alpha \mathrm{e}_{22} \mathrm{~d}} \\
& =\left[\begin{array}{ll}
\eta_{1}(\mathrm{~d}) & \eta_{2}(\mathrm{~d}) \\
\eta_{3}(\mathrm{~d}) & \eta_{4}(\mathrm{~d})
\end{array}\right] \alpha\left[\begin{array}{ll}
0 & 0 \\
\mathrm{c} & 0
\end{array}\right]+\left[\begin{array}{ll}
\mathrm{k}_{1}(\mathrm{c}) & \mathrm{k}_{2}(\mathrm{c}) \\
\mathrm{k}_{3}(\mathrm{c}) & \mathrm{k}_{4}(\mathrm{c})
\end{array}\right] \alpha\left[\begin{array}{ll}
0 & 0 \\
0 & \mathrm{~d}
\end{array}\right] \\
& =\left[\begin{array}{cc}
\eta_{2}(\mathrm{~d}) \alpha \mathrm{c} \alpha \mathrm{q} & 0 \\
\eta_{4}(\mathrm{~d}) \alpha \mathrm{c} & 0
\end{array}\right]+\left[\begin{array}{ll}
0 & \mathrm{k}_{2}(\mathrm{c}) \alpha \mathrm{d} \\
0 & \mathrm{k}_{4}(\mathrm{c}) \alpha \mathrm{d}
\end{array}\right] \\
& =\left[\begin{array}{cc}
\eta_{2}(\mathrm{~d}) \alpha \mathrm{c} \alpha \mathrm{q} & \mathrm{k}_{2}(\mathrm{c}) \alpha \mathrm{d} \\
\eta_{4}(\mathrm{~d}) \alpha \mathrm{c} & \mathrm{k}_{4}(\mathrm{c}) \alpha \mathrm{d}
\end{array}\right]
\end{aligned}
$$

$\mathrm{k}_{1}(\mathrm{~d} \alpha \mathrm{c})=\eta_{2}(\mathrm{~d}) \alpha \mathrm{c} \alpha \mathrm{q} \quad, \mathrm{k}_{2}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{2}(\mathrm{c}) \alpha \mathrm{d}$
$\mathrm{k}_{3}(\mathrm{~d} \alpha \mathrm{c})=\eta_{4}(\mathrm{~d}) \alpha \mathrm{c}, \mathrm{k}_{4}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{4}(\mathrm{c}) \alpha \mathrm{d}$
Theorem 3.5: If $M$ is a gamma ring and $J$ is a Jordan left centralizer of $M_{2}(M, \Gamma ; \sigma, q)$, then

$$
\mathrm{J}\left[\begin{array}{cc}
\mathrm{a} & \mathrm{~b} \\
\mathrm{c} & \mathrm{~d}
\end{array}\right]=\left[\begin{array}{ll}
\delta_{1}(\mathrm{a})+l_{1}(\mathrm{~b})+\mathrm{k}_{1}(\mathrm{c})+\eta_{1}(\mathrm{~d}) & \delta_{2}(\mathrm{a})+\mathrm{l}_{2}(\mathrm{~b})+\mathrm{k}_{2}(\mathrm{c})+\eta_{2}(\mathrm{~d}) \\
\delta_{3}(\mathrm{a})+\mathrm{l}_{3}(\mathrm{~b})+\mathrm{k}_{3}(\mathrm{c})+\eta_{3}(\mathrm{~d}) & \delta_{4}(\mathrm{a})+l_{4}(\mathrm{~b})+k_{4}(\mathrm{c})+\eta_{4}(\mathrm{~d})
\end{array}\right]
$$

such that
$1-\delta_{1}$ is JLC of M, $\delta_{2}(\mathrm{a} \alpha a)=0, \delta_{3}(\mathrm{a} \alpha a)=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{a})$, and $\delta_{4}(\mathrm{a} \alpha a)=0$.
2- $\eta_{2}, \eta_{4}$ are JLCs of $\mathrm{R}, \eta_{1}(\mathrm{~d} \alpha d)=0$, and $\eta_{3}(\mathrm{~d} \alpha d)=0$.
$3-l_{1}(\mathrm{a} \alpha \mathrm{b})=l_{1}(\mathrm{~b}) \alpha \mathrm{a}, \mathrm{l}_{2}(\mathrm{a} \alpha \mathrm{b})=\delta_{1}(\mathrm{a}) \alpha \mathrm{b}, l_{3}(\mathrm{a} \alpha \mathrm{b})=l_{3}(\mathrm{~b}) \alpha \sigma(\mathrm{a})$, and
$l_{4}(\mathrm{a} \alpha \mathrm{b})=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}$.
4- $k_{1}(\mathrm{~d} \alpha \mathrm{c})=\eta_{2}(\mathrm{~d}) \alpha \mathrm{c} \alpha \mathrm{q}$ and $\mathrm{k}_{2}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{2}(\mathrm{c}) \alpha \mathrm{d}$.
$\mathrm{k}_{3}(\mathrm{~d} \alpha \mathrm{c})=\eta_{4}(\mathrm{~d}) \alpha \mathrm{c}$ and $\mathrm{k}_{4}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{4}(\mathrm{c}) \alpha \mathrm{d}$.
Proof: Since J $\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]=J\left(e_{11} a\right)+J\left(e_{12} b\right)+J\left(e_{21} c\right)+J\left(e_{22} d\right)$ $=\left[\begin{array}{ll}\delta_{1}(\mathrm{a}) & \delta_{2}(\mathrm{a}) \\ \delta_{3}(\mathrm{a}) & \delta_{4}(\mathrm{a})\end{array}\right]+\left[\begin{array}{ll}\mathrm{l}_{1}(\mathrm{~b}) & \mathrm{l}_{2}(\mathrm{~b}) \\ \mathrm{l}_{3}(\mathrm{~b}) & \mathrm{l}_{4}(\mathrm{~b})\end{array}\right]+\left[\begin{array}{ll}k_{1}(\mathrm{c}) & \mathrm{k}_{2}(\mathrm{c}) \\ \mathrm{k}_{3}(\mathrm{c}) & \mathrm{k}_{4}(\mathrm{c})\end{array}\right]+\left[\begin{array}{ll}\eta_{1}(\mathrm{~d}) & \eta_{2}(\mathrm{~d}) \\ \eta_{3}(\mathrm{~d}) & \eta_{4}(\mathrm{~d})\end{array}\right]$
$=\left[\begin{array}{ll}\delta_{1}(a)+l_{1}(b)+k_{1}(c)+\eta_{1}(d) & \delta_{2}(a)+l_{2}(b)+k_{2}(c)+\eta_{2}(d) \\ \delta_{3}(a)+l_{3}(b)+k_{3}(c)+\eta_{3}(d) & \delta_{4}(a)+l_{4}(b)+k_{4}(c)+\eta_{4}(d)\end{array}\right]$,
then by lemmas 3.1, 3.2, 3.3 and 3.4 , we have the result.
Lemma 3.6: If $M$ is a gamma ring with 1 and $J$ is a $J L C$ of $M_{2}(M, \Gamma ; \sigma, q)$, then there exist additive mappings $\delta_{2}, \delta_{4}, \eta_{1}, \eta_{3}: M \rightarrow \mathrm{M}$
and elements $\mu, \vartheta, \tau, \kappa, \rho, \varepsilon, \theta$ in M , such that for all $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ in M ,
$J\left(\mathrm{e}_{11} \mathrm{a}\right)=\left[\begin{array}{cc}\varepsilon \alpha \mathrm{a} & \delta_{2}(\mathrm{a}) \\ \rho \alpha \sigma(\mathrm{a}) & \delta_{4}(\mathrm{a})\end{array}\right], \mathrm{J}\left(\mathrm{e}_{12} \mathrm{~b}\right)=\left[\begin{array}{cc}\mu \alpha \mathrm{b} & \varepsilon \alpha \mathrm{b} \\ \theta \alpha \sigma(\mathrm{b}) & \rho \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}\end{array}\right]$
$\mathrm{J}\left(\mathrm{e}_{21} \mathrm{c}\right)=\left[\begin{array}{cc}\tau \alpha \mathrm{c} \alpha \mathrm{q} & \varepsilon \alpha \mathrm{c} \\ \vartheta \alpha \mathrm{c} & \mathrm{N} \alpha \mathrm{c}\end{array}\right] \mathrm{J}\left(\mathrm{e}_{22} \mathrm{~d}\right)=\left[\begin{array}{ll}\eta_{1}(\mathrm{~d}) & \tau \alpha \mathrm{d} \\ \eta_{3}(\mathrm{~d}) & \vartheta \alpha \mathrm{d}\end{array}\right]$
Proof : From lemma 3.1, we have $\delta_{1}(\mathrm{a} \alpha a)=\delta_{1}(\mathrm{a}) \alpha$ a for all a in M.
Then, $\delta_{1}(\mathrm{a} \alpha b+b \alpha a)=\delta_{1}(\mathrm{a}) \alpha \mathrm{b}+\delta_{1}(\mathrm{~b}) \alpha \mathrm{a}$ for all $\mathrm{a}, \mathrm{b}$ in M . By putting $\mathrm{b}=1$, we get $\delta_{1}(\mathrm{a})=\delta_{1}(1) \alpha \mathrm{a}$.
And since $\delta_{3}(\mathrm{a} \alpha a)=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{a})$, then
$\delta_{3}(\mathrm{a} \alpha b+b \alpha a)=\delta_{3}(\mathrm{a}) \alpha \sigma(b)+\delta_{3}(\mathrm{~b}) \alpha \sigma(a)$. By Putting $\mathrm{b}=1$,
then $\delta_{3}(\mathrm{a})=\delta_{3}(1) \alpha \sigma(a)$.
We put $\varepsilon=\delta_{1}(1)$ and $\rho=\delta_{3}(1)$, then $\delta_{1}(\mathrm{a})=\varepsilon \alpha$ a and $\delta_{3}(\mathrm{a})=\rho \alpha \sigma(a)$.
From Lemma 3.2, $\eta_{2}(\mathrm{~d} \alpha d)=\eta_{2}(\mathrm{~d}) \alpha \mathrm{d}, \eta_{4}(\mathrm{~d} \alpha d)=\eta_{4}(\mathrm{~d}) \alpha \mathrm{d}$
and $\eta_{2}(\mathrm{~d})=\eta_{2}(1) \alpha \mathrm{d}, \eta_{4}(\mathrm{~d})=\eta_{4}(1) \alpha \mathrm{d}$. By putting $\tau=\eta_{2}(1)$ and $\vartheta=\eta_{4}(1)$, we get $\eta_{2}(\mathrm{~d})=\tau \alpha \mathrm{d}$ and $\eta_{4}(\mathrm{~d})=\vartheta \alpha \mathrm{d}$.
By the same way, from lemma 3.3, $\mathrm{l}_{1}(\mathrm{a} \alpha \mathrm{b})=l_{1}(\mathrm{~b}) \alpha \mathrm{a} \rightarrow \mathrm{l}_{1}(\mathrm{a})=l_{1}(1) \alpha \mathrm{a}$. We put $l_{1}(1)=\mu$, then $\mathrm{l}_{1}(\mathrm{a})=\mu \alpha \mathrm{a}$,
$\mathrm{l}_{2}(\mathrm{a} \alpha b)=\delta_{1}(\mathrm{a}) \alpha \mathrm{b} \rightarrow \mathrm{l}_{2}(\mathrm{a})=\delta_{1}(\mathrm{a})$,
$l_{3}(\mathrm{a} \alpha \mathrm{b})=l_{3}(\mathrm{~b}) \alpha \sigma(\mathrm{a}) \rightarrow l_{3}(\mathrm{a})=l_{3}(1) \alpha \sigma(\mathrm{a})$, put $l_{3}(1)=\theta$ then $l_{3}(\mathrm{a})=\theta \alpha \sigma(\mathrm{a})$,
and $l_{4}(\mathrm{a} \alpha \mathrm{b})=\delta_{3}(\mathrm{a}) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q} \rightarrow l_{4}(\mathrm{~b})=\delta_{3}(1) \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}=\rho \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}$.
Also, from lemma 3.4, $k_{1}(\mathrm{~d} \alpha \mathrm{c})=\eta_{2}(\mathrm{~d}) \alpha \mathrm{c} \alpha \mathrm{q}$, then $k_{1}(\mathrm{~d} \alpha \mathrm{c})=\tau \alpha \mathrm{d} \alpha \mathrm{c} \alpha \mathrm{q}$, and so $k_{1}(\mathrm{c})=$ $\tau \alpha c \alpha \mathrm{q}, \mathrm{k}_{2}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{2}(\mathrm{c}) \alpha \mathrm{d}$, implies that $\mathrm{k}_{2}(\mathrm{~d})=\mathrm{k}_{2}(1) \alpha \mathrm{d}$. We put $\varepsilon=\mathrm{k}_{2}(1)$, then we get $\mathrm{k}_{2}(\mathrm{~d})=$
$\varepsilon \alpha \mathrm{dk}_{3}(\mathrm{~d} \alpha \mathrm{c})=\eta_{4}(\mathrm{~d}) \alpha \mathrm{c}=\vartheta \alpha \mathrm{d}$ and $\mathrm{k}_{4}(\mathrm{~d} \alpha \mathrm{c})=\mathrm{k}_{4}(\mathrm{c}) \alpha \mathrm{d}$, implies that $\mathrm{k}_{4}(\mathrm{~d})=\mathrm{k}_{4}(1) \alpha \mathrm{d}$. We put $\kappa=\mathrm{k}_{4}(1)$, then we get $\mathrm{k}_{4}(\mathrm{~d})=\kappa \alpha \mathrm{d}$.
Theorem 3.7: If $M$ is a gamma ring with 1 , then $J$ is a $J L C$ of $M_{2}(M, \Gamma ; \sigma, q)$, if and only if there exist additive mappings $\delta_{2}, \delta_{4}, \eta_{1}, \eta_{3}: \mathrm{M} \rightarrow \mathrm{M}$ and elements $\mu, \vartheta, \tau, \aleph, \rho, \varepsilon, \theta$ in M , such that for all a, b, c, d in M, such that
$1-\delta_{2}(\mathrm{a} \alpha a)=0 \mathrm{and}_{4}(\mathrm{a} \alpha a)=0$.
$2-\eta_{1}(\mathrm{~d} \alpha d)=0$ and $\eta_{3}(\mathrm{~d} \alpha d)=0$.
Particularly,

$$
\mathrm{J}\left[\begin{array}{ll}
\mathrm{a} & \mathrm{~b} \\
\mathrm{c} & \mathrm{~d}
\end{array}\right]=\left[\begin{array}{cc}
\varepsilon \alpha \mathrm{a}+\mu \alpha \mathrm{b}+\tau \alpha \mathrm{c} \alpha \mathrm{q}+\eta_{1}(\mathrm{~d}) & \delta_{2}(\mathrm{a})+\varepsilon \alpha \mathrm{b}+\varepsilon \alpha \mathrm{c}+\tau \alpha \mathrm{d} \\
\rho \alpha \sigma(a)+\theta \alpha \sigma(\mathrm{b})+\vartheta \alpha \mathrm{c}+\eta_{3}(\mathrm{~d}) & \delta_{4}(\mathrm{a})+\rho \alpha \sigma(\mathrm{b}) \alpha \mathrm{q}+\kappa \alpha \mathrm{c}+\vartheta \alpha \mathrm{d}
\end{array}\right]
$$

Proof : Suppose that $J$ is a JLC of $M_{2}(M, \Gamma ; \sigma, q)$, then by lemma 2.6, these conditions are satisfied . Conversely, suppose that $J$ satisfies the conditions above, then we can show that, for any $A=\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]$ in $\mathrm{M}_{2}(\mathrm{M}, \Gamma ; \sigma, q)$,
$\mathrm{J}\left(\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right] \alpha\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right]\right)=J\left(\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right]\right) \alpha\left[\begin{array}{ll}\mathrm{a} & \mathrm{b} \\ \mathrm{c} & \mathrm{d}\end{array}\right]$.
