#### Abstract

The result involution graph of a finite group $G$, denoted by $\Gamma_{G}^{R I}$ is an undirected simple graph whose vertex set is the whole group $G$ and two distinct vertices are adjacent if their product is an involution element. In this paper, result involution graphs for all Mathieu groups and connectivity in the graph are studied. The diameter, radius and girth of this graph are also studied. Furthermore, several other graph properties are obtained.

Keywords: Mathieu Group, Result Involution Graph, Connectedness, Girth.

## 1. Introduction

Many studies have been done in order to show that the connection between graph theory and group theory. For example, if $G$ is a finite group. Then the commuting involution graph is introduced on $G$, whose vertex set a subset of involution elements in $G$ and two vertices are adjacent if they commute see [1, 2]. Furthermore, in [3, 4, 5] the most popular interest work in this context can be seen. Moreover, involution graphs, which adjacency of two vertices is defined by their product is of order 3, are describe in full details in [6]. In the recent research, Tolue [7] introduced a twin non-commuting graph of a group by partitioning the vertex set of non-commuting graph with special properties. Recently, with the aid of the computer algebra system GAP and YAGs

[^0]package [8], the result involution graph of all symmetric groups, alternating groups, dihedral groups and quatrain groups were classified in [9]. Let $G$ be a finite group act on a finite set $X$. The orbit of $x \in X$ is the set $O(x)=\{g * x: g \in G\}$. In this paper, we consider the conjugation action on $X$, so the orbit can be written as $x^{G}=\left\{x^{g}: g \in G\right\}$. In particular if the $G$ acts on itself by conjugation, then it is called the conjugacy class of $x$. The conjugacy classes partition $G$ into some equivalence classes. That is, every element in a group lies exactly in one conjugacy class. According to Atlas notation which used in [2], we are going label the conjugacy class of $x_{i}$ by the symbol $d_{i} A$ where $d_{i}$ is the order of $x_{i}$ of type $A$ and so on. For a graph $\Gamma$ by $V(\Gamma)$ and $E(\Gamma)$, we denote the set of all vertices and edges of $\Gamma$ respectively.

A graph is connected if there is a path connecting any two distinct vertices. The distance between two distinct vertices $u$ and $v$ is the length of the shortest path connecting $u$ and $v$ and denoted by $d(u, v)$ (if such a path does not exist, define $(u, v)=\infty)$. The diameter of a graph $\Gamma$, is defined by

$$
\sup \{d(u, v) \mid u, v \in V(\Gamma)\}
$$

The girth of a graph $\Gamma$, is the length of the shortest cycle in $\Gamma$. A graph with no cycles has infinite girth. The minimum among all the maximum distances between a vertex to all other vertices is considered as the radius of the graph $\Gamma$. A graph $\Gamma$ is complete if each pairof vertices is joined by an edge. We use $K_{n}$ to denote the complete graph with $n$ vertices. A vertex $v$ of a connected graph $\Gamma$ is called a cut vertex of $\Gamma$, if $\Gamma \backslash v$ (delete $v$ from $\Gamma$ ) produce a disconnected graph. The maximum clique size of $\Gamma$, denoted by $\omega(\Gamma)$, is the largest integer $k$ for which $\Gamma$ contains a clique (complete subgraph) of size $k$. In this paper we go further and extend these results to some finite groups. In particular we focus on the result involution graphs for Mathieu groups.

This paper is organized as follows. In Section 2, we provide some notation and basic facts for result involution graphs. In Section 3, we prove some results concerning for some finite groups which consists of all Mathieu groups. Several graph properties are given.

## 2.Preliminary

We begin by setting up some definition and stating a few results which will be needed later in the paper. A non-trivial element $x$ in $G$ is said to be an involution element if $x^{2}=e$. The set of allinvolution elements in $G$ is denoted by $I(G)$. It is clear that the size of $I(G)$ is the sum of thesize of involution conjugacy classes in $G$ and denoted by $t$. Recall that the number of vertices of $\Gamma_{G}^{R I}$ is $t$ and the number of edges of $\Gamma_{G}^{R I}$ can be obtained in the following result.

Proposition 2.1. [9]Let $G$ be a finite group with $t$ involution elements. Then the number of edges in $\Gamma_{G}^{R I}$ is $1 / 2(t|G|-F)$ where $F$ is the number of elements of order 4 .

A resize graph is a graph with vertex set the set of all conjugacy class of the group $G$ and two vertices are adjacent if their conjugacy class representatives are connected in $\Gamma_{G}^{R I}$.

In Example 2.3, it is clear that the resize graph of $G$ is $4 K_{2}$, this means that it has 8 vertices ( 8 conjugacy classes) and 4 edges because the class $1 A$ is only adjacent to $2 A$ ( 7 edges) and it represent by one edge and so on.

Proposition 2.2. [9] Let $G$ be a finite group. Then the resize graph of $\Gamma_{G}^{R I}$ is connected
if and only if the result involution graph $\Gamma_{G}^{R I}$ is connected.
To illustrate these results, this can be seen in the following example.
Example 2.3. The affine general linear group $G=\operatorname{AGL}(1,8)$ has eight different conjugacy classes which can be explain in Table 1.

Table 1: Vertex set and edge set of $\Gamma_{A G L(1,8)}^{R I}$.

| Conjugacy classes | 1A |  | 2A | 7A |  | 7E | 7B |  | 7C | 7D |  | 7F |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size of conjugacy class | 1 |  | 7 | 8 |  | 8 | 8 |  | 8 | 8 |  | 8 |
| Number of Edges in different classes |  | 7 |  |  | 6 |  |  | 56 |  |  | 56 |  |
| Number of edges in the same class | 21 |  |  |  |  |  |  |  |  |  |  |  |

From Table 1, we deduce that the result involution graph for $G$ is the three copy of 7regular graph over 16 vertices union 7 -regular graph over 8 vertices. It gives 4 components. A straightforward calculation shows that it is 7-regular graph with 56 vertices and 196 edges, with girth 3 . However, the resize graph of it is $4 K_{2}$.

Figure 1: The result involution graph of $\operatorname{AGL}(1,8)$.
Definition 2.4. [10] Let $a$ and $b$ be positive integers, $1 \leq a<b$. A graph $\Gamma$ is said to be $(a, b)$-biregular if its vertices have degree either $a$ or $b$, and if it possesses vertices of degree $a$ and $b$.

Theorem 2.5. [11] [Kuratowski's Theorem] A graph is non-planar if and only if it contains asubgraph homeomorphic to $K_{3,3}$ or $K_{5}$.

## 3.Main Results

In this section, we present some properties of the result involution graphs which can be seen in the following:

Proposition 3.1. For all $v \in V\left(\Gamma_{G}^{R I}\right)$,

$$
\operatorname{deg}(v)= \begin{cases}t & \text { otherwise } \\ t-1 & \text { if }|v|=4\end{cases}
$$

Proof. Since $E\left(\Gamma_{G}^{R I}\right)$ is non-empty, then we can take $v \in V\left(\Gamma_{G}^{R I}\right)$. Then there is an element in $G$ which is adjacent with $v$ that is $g v=x$ for some involution element $x$. From this wehave $g=x v^{-1}$. If $|v| \neq 4$. Then it has degree $t$. If $|v|=4$, then the
degree of it is $t-1$ because $v^{2}$ is an involution element by taking $x=v^{2}$. This force $g=v$ which is impossiblebecause $g$ and $v$ are distinct vertices.

Corollary 3.2. The result involution graph for a finite group $G$ is either $t$-regular or ( $t, t-1$ )-biregular.

Proof. The proof follows from Proposition 3.1.
Example 3.3. If $k$ is a positive integer and $G=D_{2 n}$, then

$$
\Gamma_{G}^{R I}=\left\{\begin{array}{lc}
t-\text { regular } & \text { if } n \neq 4 k \\
(t, t-1)-\text { biregular } \text { if } n=4 k .
\end{array}\right.
$$

Proposition 3.4. The result involution graph of $G$ is $K_{2^{l}}$ for some $l$ if and only if $G \cong \underbrace{C_{2} \times C_{2} \times \ldots \times C_{2}}_{\text {l-times }}$, where $C_{2}$ is a cyclic group of order 2 .

## Proof.

Let $\Gamma_{G}^{R I}$ be the result involution graph of $G$ where $G \cong \underbrace{C_{2} \times C_{2} \times \ldots \times C_{2}}_{l \text {-times }}$. It is clear that
$\left|V\left(\Gamma_{G}^{R I}\right)\right|=2^{l}$. Let $a, b \in G$. Then $a=\left(a_{1}, \ldots, a_{l}\right)$ and $b=\left(b_{1}, \ldots, b_{r}\right)$. So $a b=$ $\left(a_{1} b_{1}, \ldots, a_{l} b_{l}\right)$. We need to show that $(a b)^{2}=e$. Now have the following $(a b)(a b)=$ $\left(a_{1} b_{1} a_{1} b_{1}, \ldots, a_{l} b_{l} a_{l} b_{l}\right)=\left(a_{1}^{2} b_{1}^{2}, \ldots, a_{l}^{2} b_{l}^{2}\right)=(e, \ldots, e)=e$.
Thus $a$ and $b$ are adjacent in $\Gamma_{G}^{R I}$, but they are arbitrary elements in $G$. Therefore, $\Gamma_{G}^{R I}$ is complete graph of order $2^{l}$.
Conversely, let $a, b \in G$ and $\Gamma_{G}^{R I}=K_{2} l$. This implies that $(a b)^{2}=e$. We obtain $G$ is an abelian group of order $2^{l}$. Thus $G$ is an elementary abelian 2 -group of order $2^{l}$. Hence $G \cong \underbrace{C_{2} \times C_{2} \times \ldots \times C_{2}}_{l-\text { times }}$.

Lemma 3.5. The resize graph of the result involution graph $\Gamma_{G}^{R I}$ is a subgraph of $\Gamma_{G}^{R I}$. Proof. The proof is clear.

In Table 2, the affine special linear group $\operatorname{ASL}(3,2)$ has 11 conjugacy classes. So, we have 91 involution elements which is equal to $|2 A|+|2 B|+|2 C|$ and 60942 edges as we see in Proposition 2.1 . It is hard to draw its graph. Therefore, we draw the resize graph of it just by taking one representative from each pair of conjugacy classes and joining them together according Table 2, if it exists.

Table 2: The edges number of $\Gamma_{A S L(3,2)}^{R I}$.

| G-Class | The edges numbers |
| :---: | :---: |
| 1 A | $1 \mathrm{~A}(0), 2 \mathrm{C}(7), 2 \mathrm{~A}(42), 2 \mathrm{~B}(42)$, |
| 2 A | $2 \mathrm{~A}(189), 2 \mathrm{~B}(256), 4 \mathrm{C}(336), 4 \mathrm{~A}(1008), 4 \mathrm{~B}(336), 3 \mathrm{~B}(672), 3 \mathrm{~A}(672)$ |
| 2 B | $2 \mathrm{~B}(189), 4 \mathrm{C}(336), 4 \mathrm{~A}(336), 4 \mathrm{~B}(1008), 3 \mathrm{~B}(672), 3 \mathrm{~A}(672)$ |
| 2 C | $2 \mathrm{C}(21), 2 \mathrm{~A}(126), 2 \mathrm{~B}(126), 4 \mathrm{C}(336)$ |
| 4 A | $4 \mathrm{~A}(504), 4 \mathrm{~B}(672), 3 \mathrm{~B}(2688), 3 \mathrm{~A}(2688), 7 \mathrm{~A}(2688), 7 \mathrm{~B}(2688)$ |
| 4 C | $4 \mathrm{C}(588), 4 \mathrm{~A}(1344), 4 \mathrm{~B}(1344), 3 \mathrm{~B}(1344), 3 \mathrm{~A}(1344)$ |

| 4 B | $4 \mathrm{~B}(504), 3 \mathrm{~B}(2688), 3 \mathrm{~A}(2688), 7 \mathrm{~A}(2688), 7 \mathrm{~B}(2688)$ |
| :---: | :---: |
| 3 A | $3 \mathrm{~A}(2352), 7 \mathrm{~A}(2688), 7 \mathrm{~B}(2688)$ |
| 3B | $3 \mathrm{~B}(2352), 3 \mathrm{~A}(2240), 7 \mathrm{~A}(2688), 7 \mathrm{~B}(2688)$ |
| 7 A | $7 \mathrm{~A}(2688), 7 \mathrm{~B}(1344)$ |
| 7B | $7 \mathrm{~B}(2688)$ |

In the above table and the tables follows in this paper we use the following notations. The class of the table start with G-class $n X$, and the next class have $m Y(r)$ for a G-class $m Y$ means there are $r$-edges between the classes $n X$ and $n Y$. For Example, there are 126edges between the classes 2C and 2B as we see in the five class of Table 2.

Also, we describe in the next figure the result involution graph of $\operatorname{ASL}(3,2)$.

Figure 2: The resize graph of result involution graph of $\operatorname{ASL}(3,2)$.
Lemma 3.6. The result involution graph of $\operatorname{ASL}(3,2)$ is connected graph with girth 3 , diameter 3 and radius 2 .
proof. From Table 2, there is a path between any pair of vertices, so the result involution graph is connected. It is clear that it has three classes of involution and there is an edge between any two of them. So, it has girth three. The trivial element is only adjacent to the involution elements. In Figure 2, the greatest distance between any pair of vertices in the resize graph of $\Gamma_{G}^{R I}$, is either 2 or 3. Hence it has diameter 3 and radius 2. From Lemma 3.5 and the result follows.

Proposition 3.7. If $V_{8 n}=<a, b \mid a^{2 n}=b^{2}=1, b a=a^{-1} b^{-1}, b^{-1} a=a^{-1} b>$, then the result involution graph is a $(t, t-1)$-biregular connected graph of size $n(4 t-1)$ with girth 3, radius 3 and diameter 3, if $n>1$ is an odd positive integer.
Proof. We are going to prove that it has size $n(4 t-1)$. Now there are $2 n$ vertices of degree $t-1$ and $6 n$ vertices of degree $t$. From the hand shake lemma, we have
$2\left|E\left(\Gamma_{G}^{R I}\right)\right|=2 n(t-1)+6 n(t)$. So $\left|E\left(\Gamma_{G}^{R I}\right)\right|=n(4 t-1)$. The proof of remaining is similar to Proposition 3.6.

Proposition 3.8. If $G$ is a finite group and it has a unique conjugacy class of involution say $2 A$. Then $2 A$ is a cut vertex in the resize graph of $\Gamma_{G}^{R I}$.
Proof. Since $G$ contains only one involution class $2 A$ and it is only adjacent to the trivial class, then the number of components increase in the resize result involution graph if we remove the vertex $2 A$. Therefore, $2 A$ is a cut vertex.

For the rest, we try to find the associated result involution graphs for Mathieu groups and then several graph properties of them are given. In the following figure
provides the resize graphs of $\Gamma_{M_{11}}^{R I}$.

Figure 3: The resize graphs of $\Gamma_{M_{11}}^{R I}$.

| 11B | $11 \mathrm{~B}(3960)$ |

From above table and figure we have the following result:
Proposition 3.9. If $G=M_{11}$, then $\Gamma_{G}^{R I}$ is a connected graph with diameter 3, radius 2 and girth 3.

Proof. According to Table 3, there is a path between any pair of vertices. So $\Gamma_{G}^{R I}$ is a connected graph. Also note that the classes $2 A, 3 A$ and $4 A$ produce the cycle $C_{3}$. So, it has girth 3. Furthermore, the identity element only adjacent to the involution elements. In Figure 3, the greatest distance between any pair of vertices in the resize graphof $\Gamma_{G}^{R I}$ is either 2 or 3. Hence it has diameter 3 and radius 2. From Lemma 3.5 and the result follows.

From above table and figure we can conclude the following result:
Proposition 3.10. If $G=M_{12}$, then $\Gamma_{G}^{R I}$ is a connected graph with diameter 3, radius 2 and girth 3 .

Proof. The proof is similar as Proposition 3.9.
In the following the result involution graph resize graph are provided with full information.

From above table and figure we conclude the following result:
Proposition 3.11. If $G=M_{22}$, then $\Gamma_{G}^{R I}$ is a connected graph with diameter 3, radius 2 and girth 3.

Proof. The proof is similar as Proposition 3.9.
In the next full details on the results involution graph edges for $\Gamma_{M_{23}}^{R I}$ are given as a resize graph for $\Gamma_{M_{23}}^{R I}$.

Figure 6: The resize graphs of $\Gamma_{M_{23}}^{R I}$.
Also we provide information about the vertices and edges set for the $\Gamma_{M_{23}}^{R I}$

Table 6: The number of vertices and edges of $\Gamma_{M_{23}}^{R I}$.

From above table and figure we conclude the following result:
Proposition 3.12. If $\mathrm{G}=\mathrm{M}_{23}$, then $\Gamma_{\mathrm{G}}^{\mathrm{RI}}$ is a connected graph with diameter 3, radius 2 and girth 3.

Proof. The proof is similar as Proposition 3.9.
Finally, the resize graph for $\Gamma_{\mathrm{M}_{24}}^{\mathrm{RI}}$ are provided in the next figure

Figure 7: The resize graphs of $\Gamma_{M_{24}}^{R I}$.

Proposition 3.13. If $G=M_{24}$, then $\Gamma_{G}^{R I}$ is a connected graph with diameter 3, radius 2 and girth 3.
Proof. The proof is similar as Proposition 3.9.
Example 3.14. If $G$ is isomorphic to one of the following groups: $M_{11}, M_{22}, M_{23}$, then the vertex $2 A$ in the resize result involution graph is a cut vertex.

Proposition 3.15. If $G$ is isomorphic to one of the following groups: \{ $\left.M_{11}, M_{12}, M_{22}, M_{23}, M_{24}\right\}$. Then the clique numbers of resize graphs of $\Gamma_{G}^{R I}$ are $8,11,10$, 14 and 22 respectively.

Proof. According to Table 3, the complete subgraphs obtained by removing the classes $1 A$ and $2 A$. Therefore, the clique number of resize graph of $\Gamma_{M_{11}}^{R I}$ is 8 . The proof of the remaining is similar.
Corollary 3.16. If $G$ is isomorphic to one of the following groups $\left\{M_{11}, M_{12}, M_{22}, M_{23}, M_{24}\right\}$.Then the graph $\Gamma_{G}^{R I}$ is non-planer.

Proof. From Proposition 3.11, we obtain the resize graph of $\Gamma_{G}^{R I}$ contains a subgraph which is isomorphic to $K_{5}$ and it lies in $\Gamma_{G}^{R I}$. So, by Theorem 2.5 and the result follows.

## 4. Conclusion

We showed that the result involution graph for a finite group is either regular or biregular. In particular, there is a one to one correspondence between elementary abelian 2-groups and complete graphs. Furthermore, the result involution graph for the Mathieu simple groups have been investigated. Many results have obtained. For example, the diameter, girth, radius and clique number for the result involution graph are calculated.
